HAKUM AUTO CARE · INTERNAL BRIEF

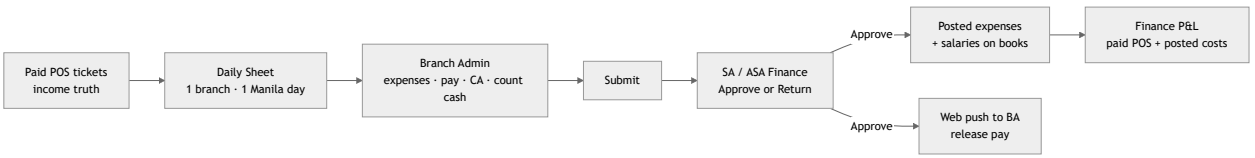

Finance & Daily Sheet computations

How every peso is calculated — from paid POS tickets, through the Daily Sheet (expenses, salaries, cash advances, drawer), to Finance P&L. Source of truth in code: `src/lib/dailySheet.js`, `src/lib/salesSummary.js`, `src/lib/compensation.js`, and SQL `daily_sheet_server_totals`.

POS + Finance share one formula set | Money in centavos (÷100 = pesos) | Asia/Manila business day

Prepared 18 Oct 2026

1. Money path (who owns what)

- **Sales cannot be typed** on the sheet — they come only from paid POS tickets that day.
- **Expenses and salaries on a draft do not hit the books** until the sheet is approved.
- **Cash advances are not costs** — they move drawer cash only; they never change net profit.
- Crew are paid only after **Approve** (same-day release by Branch Admin).

2. Sales on the Daily Sheet

Only tickets with status `paid` or `refunded` count. Manila calendar date of `occurred_at` must match the sheet's business date.

```
Gross = Σ (total + discount) for paid & refunded
```

```
Discounts = Σ discount on those tickets
```

```
Refunds = Σ total where status = refunded
```

```
Net sales = Σ total where status = paid
```

```
Transactions = count of paid tickets
```

```
Average sale = Net ÷ Transactions
```

Payment buckets (Cash / GCash / Card / Bank / Other) sum the *paid* ticket totals by method. Unknown methods go to **Other** — they never invent drawer cash.

```
Cash sales (drawer) = Σ paid totals where payment method is cash (blank method = cash)
```

3. Daily Sheet — expenses, salaries, profit, drawer

Every expense and salary line is treated as paid from the cash drawer. JS (`computeSheetTotals`) and SQL (`daily_sheet_server_totals`) use the same arithmetic.

Money out (costs)

```
Expenses = Σ amount of kind = expense
```

```
Salaries = Σ amount of kind = salary
```

```
Total costs = Expenses + Salaries
```

```
Net profit (day) = Net sales − Total costs
```

Cash advances (not costs)

```
CA given out = Σ kind = ca_release
```

```
CA paid back = Σ kind = ca_repay
```

Advances never enter Net profit. They only change Expected cash.

Drawer

```
Expected cash =
  Opening float
  + Cash sales
  + CA paid back
  − Expenses − Salaries − CA given out
```

```
Over / Short = Counted cash − Expected cash
```

If Over/Short ≠ 0, a note is required before Submit.

4. Worked example (one branch, one day)

Illustrative numbers only — to verify the formulas read correctly.

ITEM	AMOUNT (₱)
Gross sales	50,000.00
Discounts	(2,000.00)
Refunds	(500.00)
Net sales (paid tickets)	**47,500.00**
of which Cash	20,000.00
of which GCash / Card / Other	27,500.00
Expenses (supplies, meals, …)	(3,500.00)
Salaries (crew pay on sheet)	(8,000.00)
Net profit (day)	**36,000.00**
Opening float	5,000.00
CA given out	(300.00)
CA paid back	100.00
Expected cash	**13,300.00**
Counted cash	13,250.00
Over / Short	**(50.00) short**

```
Expected = 5,000 + 20,000 + 100 − 3,500 − 8,000 − 300 = 13,300
Net profit = 47,500 − 3,500 − 8,000 = 36,000 (CA does not appear)
```

5. Suggested crew pay (Settings → Daily sheet rules)

Suggestions only. Branch Admin may change any amount; a change needs a reason. Pay posts when the sheet is approved.

Per person suggestion

```
Suggested pay = Daily rate + Wash pool share + Detailing share
```

Wash pool (bay crew)

1. Wash-eligible sales = paid car wash / package lines (not merch, not PPF, not detailing).
2. Pool = Wash-eligible sales × **wash_pool_pct** (default **35%**).
3. Split across clocked-in bay crew by attendance weight.
4. **Excluded from pool:** Team Lead, Detailer, Admin, Sales, Marketing, Investor.

```
Person share = Pool × (their weight ÷ sum of weights)
```

Default weights: Present = 1.0 · Late = 0.7 · Absent = 0. With clock-in time, weight can be remaining shift ÷ scheduled shift.

Detailing / ceramic share

1. Start from detailing job amount.
2. Optional: subtract free shirt (default ₱500) and card fee % (default 3.5%).
3. Crew % (solo default 20%, or split 10% when detailer assigned) + Detailer % (default 10%).

Team Lead / daily rate

Team Leads use `staff_profiles.daily_rate_minor` (only SA / ASA with finance_write may set it). That amount is the daily portion of their suggestion; they are not in the wash pool.

Monthly office salaries

Branch Admins and office staff monthly pay are entered as **Finance** → **Bills** under account **14** — not on the bay Daily Sheet.

6. Expenses & Finance P&L

When expenses hit the books

- Sheet expense / salary lines → posted as paid expenses on **Approve** (once; approve again posts nothing new).
- Finance Bills (rent, utilities, office salary, …) → P&L when status is paid / posted.
- P&L income = **paid POS only**. Sheet never invents revenue.

```
P&L Income = Σ finance_daily_pl
where kind = income
```

```
P&L Expenses = Σ finance_daily_pl
where kind = expense
```

```
P&L Net = Income − Expenses
```

```
Margin % = Net ÷ Income × 100
```

Expense accounts (Xero-style codes)

CODE	ACCOUNT
10	Meals and Entertainment
11	Apparel Inventory
12	Chemical and Other Inventory
13	Coffee and Other Supplies
14	Employee Salary and Incentives
15	Equipments and Tools
16	Labor and Repair Maintenance
17	Marketing Expenses
18	Online Expenses and Others
19	Rent and Operating Utilities
20	Shipping and/or Delivery Fees
21	Taxes and Accounting Fees

Crew salaries from the Daily Sheet post under **14**.

7. Sanity checklist (does this make sense?)

- **OK** Net profit ignores cash advances — advances are loans to / from crew, not shop cost.
- **OK** Expected cash only adds *cash* sales, not GCash/card — those never entered the drawer.
- **OK** POS screen and Finance sheet show the same totals (one JS module + matching SQL).
- **OK** Approver cannot approve their own submitted sheet (owner / BossMich exempt).
- **NOTE** Suggested pay ≠ guaranteed pay. BA override + reason is intentional.
- **NOTE** Wash pool % and ceramic % live in Settings → Daily sheet rules (defaults above).

Appendix — Engineering deepening notes

Architecture · not for floor ops

Vocabulary: **module**, **interface**, **depth**, **seam**, **adapter**, **leverage**, **locality**.

Keep sheet totals one deep module

Strong in-process

Files: `dailySheet.js` · `daily_sheet_server_totals` · POS Daily Sheet · Finance Daily sheets

Problem: Drawer arithmetic used to leak into separate METHOD maps (BUG-081 / BUG-086).

Solution: Keep all day-money formulas behind `computeSheetTotals` / SQL twin; screens only display.

Wins: Locality of money bugs · One test surface · POS/Finance cannot disagree

Salary suggestion as one pay-preview module

Worth exploring in-process

Files: `suggestSalaries` → `buildPayrollPreview` → `compensation.js`

Problem: Understanding one day's suggested pay requires three modules.

Solution: Deepen a single "day pay suggestion" interface that returns parts (daily / wash / detailing) without callers knowing wash-pool internals.

Server sales rollup for Finance year views

Speculative ports & adapters

Files: `salesSummary.js` (browser rollup over raw sales)

Problem: Large date ranges roll up in the browser (noted ceiling in code).

Solution: Optional `finance_sales_summary` view adapter — only if year-scale loads hurt.

Top recommendation: protect the sheet-totals module — do not re-split Expected cash math into screens.
